

Flask

Using Flask()

- Filters are part of the Flask application not the Blueprint
- You use the `jinja_env.filters` to create filters

```
• • •  
<div class="json-container">  
  <pre>  
    {{ request.session['userinfo'] | to_pretty_json }}  
  </pre>  
</div>  
• • •
```

FastAPI

Using FastAPI() or APIRouter()

- Is part of the Jinja2Templates class
- Use the variable `env.filters` to define filters

```
# FastAPI  
  
templates.env.filters['filter'] = filter  
  
# Flask  
  
app.jinja_env.filters['filter'] = filter
```
