

Flask

```
from utils import to_pretty_json
```

```
app = Flask(__name__)
```

```
...
```

Using Flask()

- Filters are part of the Flask application not the Blueprint

Flask

```
from utils import to_pretty_json

app = Flask(__name__)
...

app.jinja_env.filters['to_pretty_json'] = to_pretty_json
```

Using Flask()

- Filters are part of the Flask application not the Blueprint
- You use the `jinja_env.filters` to create filters
- Follows the dictionary interface
